Abstract of JP7284412

PURPOSE:To enable the message of gingivae and the removal of sordes on teeth by planting bundles of the filaments having different shapes of both tips to simultaneously perform brushing corresponding to the shape of each tooth tip. **CONSTITUTION:**A brush head 2 is previously formed with a plurality of bristle planting holes 3. Bundles 4...4 of the filaments 1 are bent into the U-shaped form and the bent parts of the filament bundles 4 are drivably planted in the bristle planting holes 3...3 together with locking piecelike wires. Then, the bent part of the filament 1 is located somewhat near the spherical tip to plant the filament bundle while the spherical tip is deviated from the tapered tip. Thus, the flexible tapered tips are liable to enter a pocket in the surrounding of tooth with a slight brushing pressure without being hindered by the spherical tip so that the sordes on tooth accumulated in the pocket in the surrounding of the tooth can be surely removed. Also, at the same time the brushing effect by the spherical tip can be obtained.
